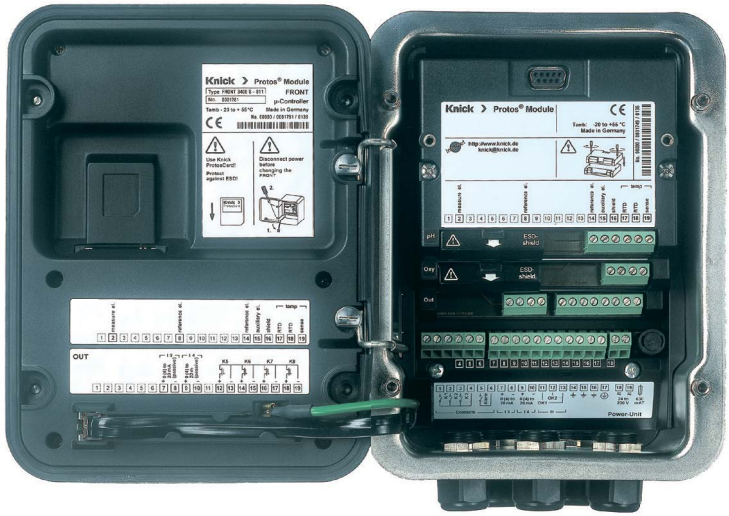
User Manual

Protos II 4400(X) / Protos 3400(X) Process Analysis System

Protos CONDI 3400(X)-051 Measuring Module
For Conductivity Measurement with Toroidal Sensors



Latest Product Information: www.knick.de

Returns

Clean and securely package the product before returning it to Knick Elektronische Messgeräte GmbH & Co. KG if required.
If there has been contact with hazardous substances, the product must be decontaminated or disinfected prior to shipment. The consignment must always be accompanied by a corresponding return form to prevent service employees being exposed to potential hazards.
Further information can be found at www.knick.de.

Disposal

The local codes and regulations must be observed when disposing of the product.

Table of Contents

Protos CONDI 3400(X)-051 Module

Table of Contents

Protos CONDI 3400(X)-051 Module

Intended Use

The module is an input module for conductivity measurement with standard analog electrodeless (toroidal) sensors.

The CONDI 3400X-051 module is intended for operation in locations subject to explosion hazards which require equipment of Group II, device category 2(1), gas/dust.

Safety Instructions

Operation in Explosive Atmospheres: CONDI 3400X-051 Module
The module is approved for operation in explosive atmospheres.
When installing the product in a hazardous location, observe the information in the supplements to the certificates and, if applicable, the relevant control drawings.
Observe all applicable local and national codes and standards for the installation of electrical equipment in explosive atmospheres. For orientation, please refer to IEC 60079-14, EU directives 2014/34/EU and 1999/92/EC (ATEX), NFPA 70 (NEC), ANSI/ISA-RP12.06.01.

⚠ **WARNING!** Possible impairment of explosion protection.

- Modules which have already been used shall be subjected to a professional routine test before they may be operated in another type of protection.
- Prior to commissioning, the operating company must verify the intrinsic safety in accordance with the installation regulations of IEC 60079-14 for the complete interconnection of all equipment involved, including the connecting cables.
- The interconnection of Ex and non-Ex modules (mixed assembly) is not permitted.
- In hazardous locations the device shall only be cleaned with a damp cloth to prevent electrostatic charging.

Maintenance
The Protos modules cannot be repaired by the user. For inquiries regarding module repair, please contact Knick Elektronische Messgeräte GmbH & Co. KG at www.knick.de.

Firmware Version

CONDI 3400(X)-051 module firmware: Firmware version 2.x

Module compatibility	CONDI3400-051	CONDI3400X-051
Protos 3400 from FRONT firmware version 3.0	x	
Protos 3400X from FRONT firmware version 4.0		x
Protos II 4400 from FRONT firmware version 01.00.00	x	
Protos II 4400X from FRONT firmware version 01.00.00		x

Further information on the firmware version history can be found at www.knick.de.

Query Current Device Firmware/Module Firmware

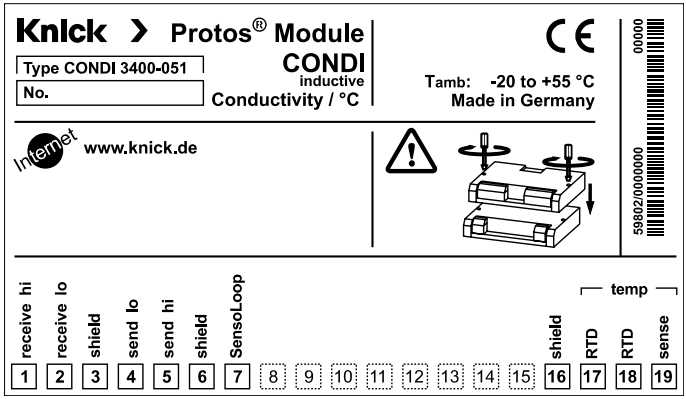
When the device is in measuring mode:

Press **menu** key, open Diagnostics menu: Device Description

Menu	Display	Action
diag		**Device hardware and firmware version** Provides information on all modules installed: Module type and function, serial number, hardware and firmware version, and device options. Select the different modules (FRONT, BASE, slots 1 - 3) using the arrow keys.
		**Query module firmware** Module CONDI 3400-051, hardware and firmware version, serial number – here installed in slot 3.

Note: The display may vary depending on the device version.

Terminal Plate CONDI 3400-051 Module



Attaching the Terminal Plates

The terminal plates of the lower modules can be sticked to the inner side of the door. This facilitates maintenance and service.

Installing the Module

⚠ **CAUTION!** Electrostatic discharge (ESD).
The modules' signal inputs are sensitive to electrostatic discharge.
Take measures to protect against ESD before inserting the module and wiring the inputs.

NOTICE! Strip the insulation from the wires using a suitable tool to prevent damage.

1) Switch off the power supply to the device.
2) Open the device (loosen the 4 screws on the front).
3) Plug the module into the slot (D-SUB connector), see figure.
4) Tighten the module's fastening screws.
5) Connect the sensor and separate temperature probe if necessary, see "Wiring Examples".
6) Check whether all connections are correctly wired.
7) Close the device by tightening the screws on the front.
8) Switch on the power supply.

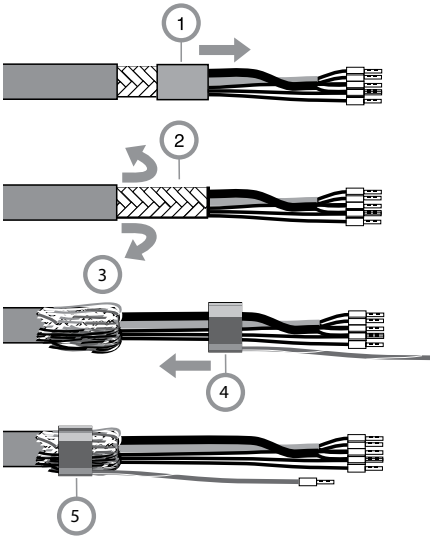
⚠ **CAUTION!** Risk of losing the specified ingress protection.
Fasten the cable glands and screw together the housing correctly.
Observe the permissible cable diameters and tightening torques (see the specifications of the basic unit).
Insert blanking plugs or sealing inserts if necessary.

Connection of SE 655 / SE 656 Sensors

Preparing the Special Cable

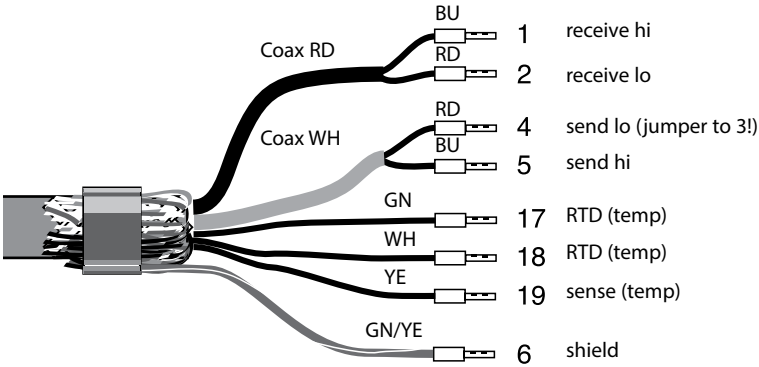
Preparing the Shield Connection

Pre-assembled special cable for SE 655 / SE 656 sensors



- Insert the special cable through the cable entry into the terminal compartment.
- Remove the already separated part of the cable insulation (1).
- Turn the shielding mesh (2) over the cable insulation (3).
- Then shift the crimp ring (4) over the shielding mesh and tighten it using a pince (5)

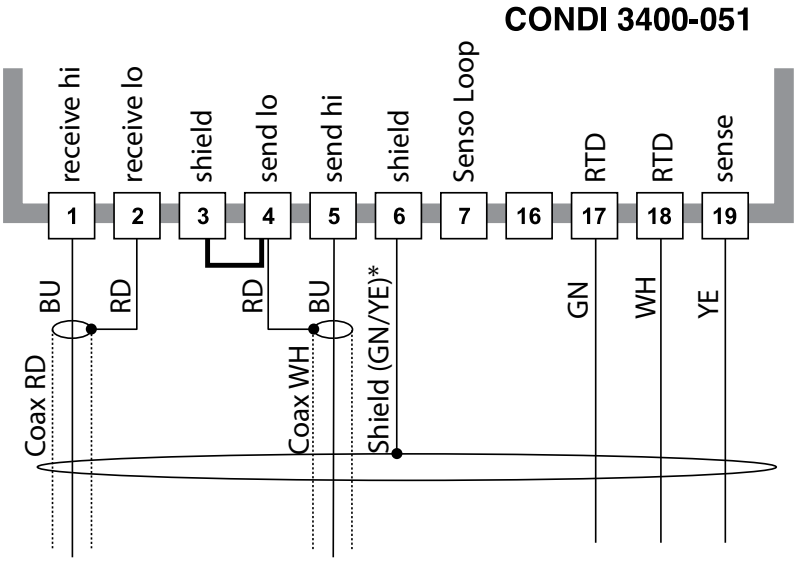
Pre-Assembled Special Cable:



Wiring Examples

SE 655/SE 656 Sensor

Connecting the pre-assembled cable



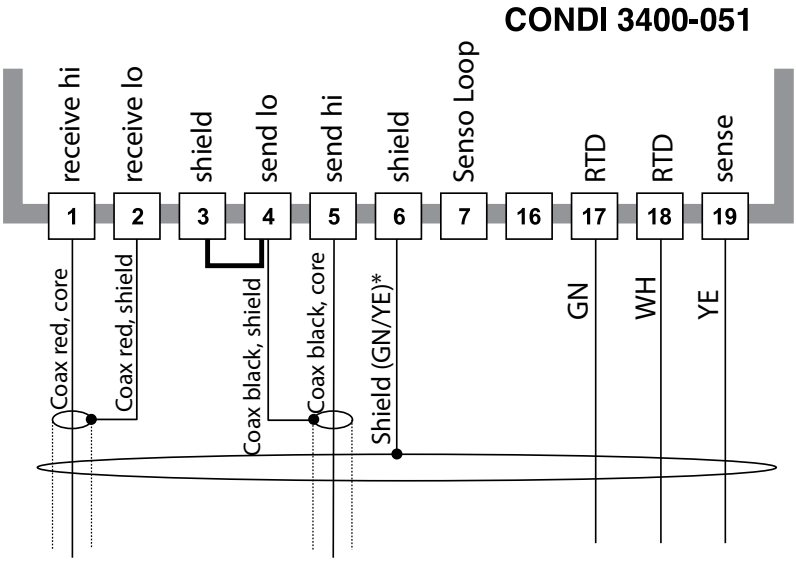
Note

- The shield wire (*, GN/YE) must be connected to the shielding mesh of the special cable using a crimp ring (see ”Preparing the shield connection”).
- Remove the pre-mounted jumper between terminals 18 and 19!

Wiring Examples

SE 660 Sensor

Connecting the pre-assembled cable



Note

- The brown wire is not connected.
- Remove the pre-mounted jumper between terminals 18 and 19!

Calibration / Adjustment

Note: Function check (HOLD) active for the currently calibrated module
Current outputs and relay contacts behave as configured

- **Calibration:** Detecting deviations without readjustment
- **Adjustment:** Detecting deviations with readjustment

NOTICE!
Without calibration every conductivity meter delivers an imprecise or wrong output value! Mechanical tolerances of the sensor as well as magnetic crosstalk between send and receive coils reduce the measurement accuracy.
To increase accuracy, it is useful to perform an adjustement.
Additional measurement errors occur when the sensor is installed in a restricted space (container wall < 4 x sensor diameter). This can be compensated for by product calibration, for example. When measuring low conductivity values, a zero correction is recommended.
Be sure to perform an adjustment after having replaced the sensor!

Procedure
Every conductivity sensor has its individual cell factor.
Depending on the sensor design, the cell factor may vary over a wide range. As the conductivity is calculated from the measured conductance and the cell factor, this must be known to the measuring system. For calibration or sensor standardization, either the known (stamped on) cell factor of the conductivity sensor used is entered in the measuring system or it is determined automatically by measuring a calibration solution with a known conductivity. The data are stored in a calibration record. By "Adjustment" the determined calibration data can be used for correction.

- Use fresh calibration solutions only!
- The calibration solution used must have been selected during parameter setting.
- Calibration accuracy decisively depends on the exact detection of the calibration solution's temperature. Using the measured or entered temperature, the measuring module determines the nominal value for the calibration solution from a stored table.
- Observe response time of temperature probe!
- For exact determination of the cell factor, wait until the temperature probe and calibration solution have the same temperature.

Adjustment
means that the cell factor determined by a calibration is taken over.
It is entered in the calibration record. (Cal record can be called up in the Diagnostics menu for the CONDI 3400(X)-051 module.)
The value is only effective for calculating the measured variables when the calibration has been terminated with an adjustment.
A passcode ensures that an adjustment can only be performed by an authorized person (Administrator). The Operator can check the current sensor data by a calibration and inform the Administrator when there are deviations. You can use the add-on function SW3400-107 [1)] for granting access rights (passcodes) and for AuditTrail (continuous data recording and backup according to FDA 21 CFR Part 11).

Menu	Display	Action
cal	HOLD 1.225 mS/cm 25.6 °C Calibration data record Calibration 03/31/10 12:30 Cal mode Automatic Cal temp 25.6 °C Conductivity 0249 mS/cm Cell factor 0.998 S/cm End / Adjust	**Administrator** With the corresponding access rights, the device can immediately be adjusted after calibration. The calibration values are taken over for calculating the measured variables.
	HOLD 1.225 mS/cm 25.6°C Module CONDI 3400-051 Stored calibration data record Calibration 03/31/10 12:30 Start new calibration View/adjust calibration data record Return	**Operator** (without administrator rights) After calibration, change to measuring mode. Inform Administrator. When opening the menu (Calibration, respective module), the Administrator sees all data of the last calibration and can take over the values or perform a new calibration.

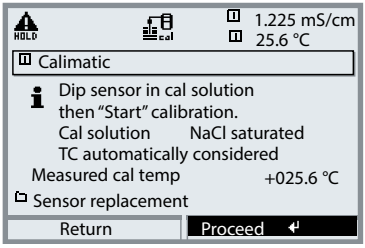
Note: The display may vary depending on the device version.

1) with Protos 3400(X)

Temperature Compensation During Calibration

The conductivity value of the calibration solution is temperature-dependent. For calibration, the calibration solution temperature must therefore be known in order to choose the actual value from the conductivity table.
During parameter setting you define whether cal temperature is measured automatically or must be entered manually.

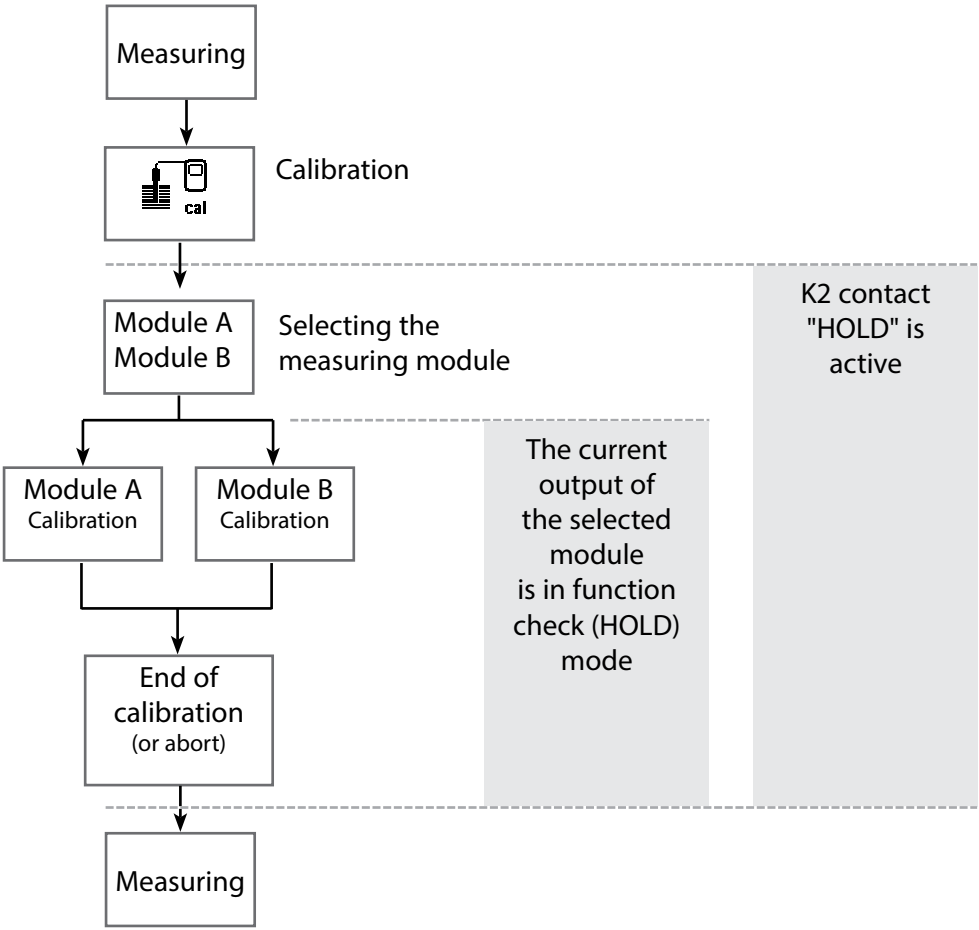
Automatic Temperature Compensation



For automatic cal temp detection, the measuring module measures the temperature of the calibration solution with a temperature probe (Pt 100 / Pt 1000 / NTC 30 kΩ / NTC 100 kΩ). If you work with automatic temperature compensation during calibration, a temperature probe connected to the temperature input of the Protos must be in the calibration solution. When "Cal temp automatic" is set, "Measured cal temp" appears in the menu.

HOLD Function During Calibration

Behavior of the signal and relay outputs during calibration



Menu	Display	Action
	  	**Open calibration** Press **menu** key to select menu. Select calibration using arrow keys, confirm using **enter**, passcode 1147 (The passcode can be edited by the administrator.) Calibration: Select "Module CONDI" Select calibration method: • Automatic with standard cal solution • Manual entry of cal solution • Product calibration • Data entry - premeasured sensor • Zero correction • Temp probe adjustment (with Protos II 4400(X)) When you call up calibration, the analyzer automatically proposes the previous calibration method. If you do not want to calibrate, "Return" with the left softkey. **During calibration the module is in function check (HOLD) mode.** Current outputs and relay contacts of the module behave as configured (Module BASE).

Note: The display may vary depending on the device version.

Calibration / Adjustment

Automatic Calibration with Standard Calibration Solution

Automatic with Standard Calibration Solution
For automatic calibration, the conductivity sensor is immersed in a standard calibration solution (NaCl or KCl, selected during parameter setting).
From the measured conductance and temperature, the Protos automatically calculates the cell factor.
The temperature dependence of the calibration solution is taken into account.

During calibration the module is in function check (HOLD) mode.
Current outputs and relay contacts of the module behave as configured (Module BASE).

NOTICE!
- Use fresh calibration solutions only!
- The calibration solution used must have been selected during parameter setting.
- Calibration accuracy decisively depends on the exact detection of the calibration solution's temperature. Using the measured or entered temperature, the Protos determines the nominal value for the calibration solution from a stored table.
- Observe response time of temperature probe!
- For exact determination of the cell factor, wait until the temperature probe and calibration solution have the same temperature.

Be sure to observe during calibration:
- If the measured conductance or the measured temperature fluctuate greatly, the calibration procedure is aborted after 2 min.
- If an error message appears, you have to repeat calibration.

Adjustment: Taking over the values determined by calibration
- When the values determined by calibration are correct, they must be taken over to adjust the analyzer.

Menu	Display	Action
cal		Select calibration menu Select "Module CONDI" Select calibration method "Automatic with standard cal solution", confirm with **enter**.
		Display of selected calibration solution. Enter process temperature, if manual temperature adjustment has been selected. Dip sensor in calibration solution. Start calibration with softkey or **enter**.
		Calibration is running. The display shows: • Calibration temperature • Solution table value (conductivity in dependence on process temperature) • Response time Rinse sensor and replace it in the process, end calibration with softkey or **enter**
		**Adjustment** Press "Adjust" to take over the values determined during calibration for calculating the measured variables.

Note: The display may vary depending on the device version.

Manual Entry of Calibration Solution
For calibration with manual entry of the calibration solution's conductivity, the sensor is immersed in a calibration solution. Protos determines a conductivity/ calibration temperature value pair. Then, the temperature-corrected conductivity value of the solution must be entered. To do this, read off the conductivity for the temperature displayed from the TC table of the calibration solution. Intermediate temperature values must be interpolated.
Protos automatically calculates the cell factor.

During calibration the module is in function check (HOLD) mode.
Current outputs and relay contacts of the module behave as configured (Module BASE).

NOTICE!
- Use fresh calibration solutions only!
- The calibration solution used must have been selected during parameter setting.
- Calibration accuracy decisively depends on the exact detection of the calibration solution's temperature. Using the measured or entered temperature, the Protos determines the nominal value for the calibration solution from a stored table.
- Observe response time of temperature probe!
- For exact determination of the cell factor, wait until the temperature probe and calibration solution have the same temperature.

Be sure to observe during calibration:
- If the measured conductance or the measured temperature fluctuate greatly, the calibration procedure is aborted after 2 min.
- If an error message appears, you have to repeat calibration.

Adjustment: Taking over the values determined by calibration
- When the values determined by calibration are correct, they must be taken over to adjust the analyzer.

Menu	Display	Action
cal		Select calibration menu Select "Module CONDI" Select calibration method "Manual entry of cal solution", confirm with **enter**.
		Enter process temperature, if manual temperature adjustment has been selected. Immerse sensor in cal solution. Start calibration with softkey or **enter**.
		Calibration is running. The display shows: • Calibration temperature • Response time
		Enter conductivity. End calibration using softkey ("End").
		**Adjustment** Press "Adjust" to take over the values determined during calibration for calculating the measured variables.

Note: The display may vary depending on the device version.

Product Calibration (Calibration by Sampling)
When the sensor cannot be removed, e.g. for sterility reasons (for biotechnical processes), its cell constant can be determined with "sampling".
To do so, the currently measured process value (conductivity or concentration [1)]) is saved by the Protos.
Immediately afterwards, you take a sample from the process. The sample value should be measured at process conditions (same temperature!). The determined value is entered in the measuring system. From the difference between process value and sample value, the Protos calculates the cell constant of the conductivity sensor.

During calibration the module is in function check (HOLD) mode.
Current outputs and relay contacts of the module behave as configured (Module BASE).

Product calibration without TC correction (for conductivity)
Take a sample from the process. Measure its value at the temperature at which the sample has been taken ("Sample temp", see display). To do so, it may be necessary to thermostat the sample correspondingly in the lab.
Temperature compensation must be turned off at the comparison meters (TC = 0 %/K).

Product calibration with TC correction Tref = 25 °C/77 °F (for conductivity)
Take a sample from the process. When measuring in the lab (TC linear), be sure that the same values are set for reference temperature and temperature coefficient in the comparison meter and in the Protos. Furthermore, the measuring temperature should correspond to the sample temperature (see display).
Transport the sample in an insulated container (Dewar).

NOTICE!
Product calibration can only be performed if the process medium is stable. That means, for example, that there are no chemical reactions which have an effect on the process conductivity. At higher temperatures, the sample values can also be invalidated due to evaporation.

1) with Protos II 4400(X) and add-on function FW4400-009

Menu	Display	Action
cal	    	Select calibration. Select COND module. Select Calibration Mode > Product and press **enter** to confirm. Select Process Variable > Conductivity or Concentration[1)]. Conductivity: calibration with/without temperature compensation Concentration: Select the medium. **Step 1** Take sample. Store measured value and temperature at the moment of sampling ("Save" softkey or **enter**). The analyzer automatically returns to calibration mode selection. Press **meas** to return to measurement. **Exception:** Sample value can be determined and entered on site: Left softkey: "Entry" **Step 2** Lab value has been measured. Open the calibration menu again. Right softkey: "Entry" Enter reference value ("Lab value"). Confirm with "OK" or repeat calibration. **Adjustment** Press "Adjust" softkey to take over the values determined during calibration for calculating the measured variables.

Note: The display may vary depending on the device version.

1) with Protos II 4400(X) and add-on function FW4400-009

Data Entry of Premeasured Sensors
Entry of cell factor and zero point of a sensor, related to 25 °C/77 °F, 1013 mbar.

During calibration the module is in function check (HOLD) mode.
Current outputs and relay contacts of the module behave as configured (Module BASE).

Menu	Display	Action
cal		**Select module: CONDI** During calibration, the output currents (1 and 2), limit contacts, and controller output are in HOLD mode. Confirm with **enter**
		Select calibration method "Data entry" Confirm with **enter**
		Enter the cell factor of a premeasured sensor. Confirm with "OK" or repeat calibration. With "Concentration" enabled, a concentration calibration can be performed by changing the cell factor value – ***NOTICE!*** The cell factor value is immediately changed in the memory, even if calibration is aborted by pressing **meas**.

Note: The display may vary depending on the device version.

Calibration / Adjustment

Zero Correction

Zero Correction
Adjustment of zero point / Automatic determination of the zero point in air
Every electrodeless (toroidal) conductivity sensor has its individual zero point. When measuring low conductivity values, accuracy can be increased by adjusting the zero point.

During calibration the module is in function check (HOLD) mode.
Current outputs and relay contacts of the module behave as configured (Module BASE).

Menu	Display	Action
cal		**Select module: CONDI** Confirm with **enter** Select calibration method "Zero correction" Remove the sensor from the process and dry it. Confirm with **enter** Permissible zero point deviation depends on the sensor type. For the SE 655 (SE656), it is ± 0.050 mS/cm. Press **Adjust** to take over the calibration data.

Note: The display may vary depending on the device version.

Temp Probe Adjustment

Note: With Protos II 4400(X) in the Calibration menu,
with Protos 3400(X) in the Maintenance menu.

Temp Probe Adjustment
This function allows compensating for the individual temperature probe tolerance and the influence of the lead resistances to increase the accuracy of temperature measurement. Make sure that the process temperature is precisely measured using a calibrated reference thermometer when performing an adjustment. The measurement error of the reference thermometer should be less than 0.1 °C. Adjustment without precise measurement might result in considerable deviations of the measured value display!

With Protos II 4400(X), the data from the last adjustment and the temperature offset can be called from the Diagnostics menu, see p. 51.

Parameter Setting

⚠ CAUTION!
Incorrect parameter setting, calibration or adjustment may result in incorrect measurements being recorded. Protos must therefore be commissioned by a system specialist, all its parameters must be set, and it must be fully adjusted.

NOTICE!
The "function check" (HOLD) mode is active during parameter setting.
The behavior of the current outputs depends on the parameter setting, i.e., they may be frozen at the last measurement or set to a fixed value. The red "Alarm" LED blinks.
Measurement operations must not be carried out while the Protos is in the function check (HOLD) mode, as this may put the user at risk due to unexpected system behavior.

Menu	Display	Action
		**Open the Parameter Setting menu** From the measuring mode: Press **menu** key to select menu. Select parameter setting using arrow keys, press **enter** to confirm

Parameter Setting: Operating Levels

Viewing level, Operator level, Administrator level
Note: Function check (HOLD) mode active (Setting: BASE module)

Menu	Display	Action
par		**Open parameter setting** From the measuring mode: Press **menu** key to select menu. Select parameter setting using arrow keys, press **enter** to confirm.
		**Administrator level** Access to all functions, also passcode setting. Releasing or blocking a function for access from the Operator level.
		Functions which can be blocked for the Operator level are marked with the "lock" symbol. The functions are released or blocked using the softkey.
		**Operator level** Access to all functions which have been released at the Administrator level. Blocked functions are displayed in gray and cannot be edited (Fig.). **Viewing level** Display of all settings. No editing possible!

Note: The display may vary depending on the device version.

Parameter Setting: Locking a Function

Administrator level: Enabling/locking functions for Operator level
Note: Function check (HOLD) mode active (Setting: BASE module)

Menu	Display	Action
par		**Example:** Blocking access to the calibration adjustments from the Operator level **Open parameter setting** Select Administrator level. Enter passcode (1989). Select "Module COND" (e.g.) using arrow keys, press **enter** to confirm.
		Select "Cal preset values" using arrow keys. "Block" with softkey.
		Now, the "Cal preset values" line is marked with the "lock" icon. This function cannot be accessed from the Operator level any more. The softkey function changes to "Release".
par		**Open parameter setting** Select Operator level, passcode (1246). Select "Module COND". Now, the locked function is displayed in gray and marked with the "lock" icon.

Note: The display may vary depending on the device version.

Menu	Display	Action
par		**Activating parameter setting** From the measuring mode: Press **menu** key to select menu. Select parameter setting using arrow keys, press **enter** to confirm. Passcode as delivered: 1989
		Select module, press **enter** to confirm. (In the Figure, the "Module COND" is selected, for example.)
		Select parameter using arrow keys, press **enter** to confirm.

Note: The display may vary depending on the device version.

During parameter setting the analyzer is in function check (HOLD) mode:
Current outputs and relay contacts behave as configured (BASE module).

Parameter Setting

Default Settings and Selection Range
Note: Function check (HOLD) mode active.

Note: The menus may vary depending on the device version.

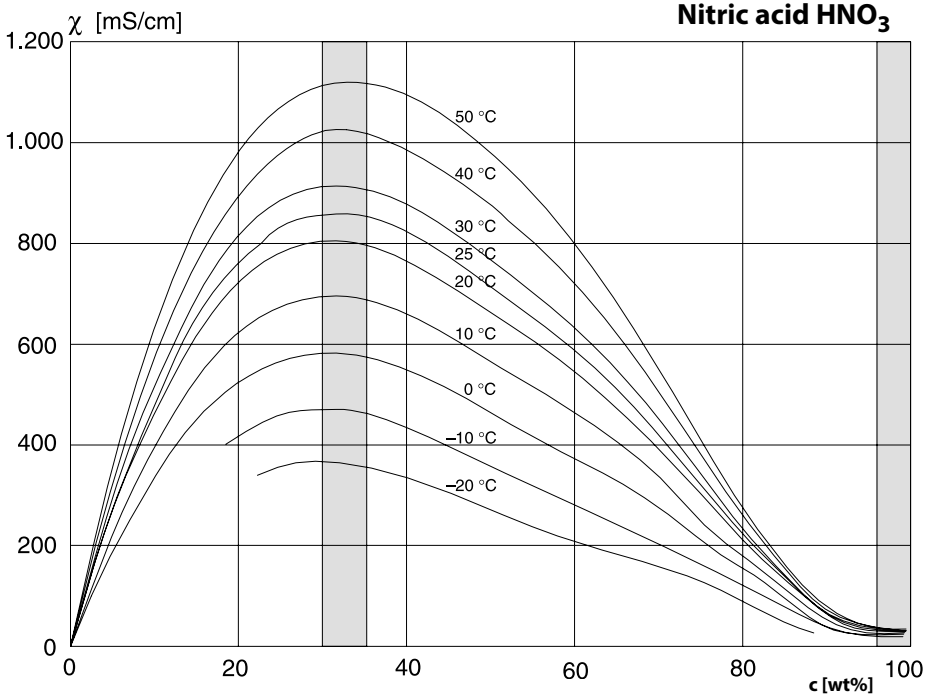
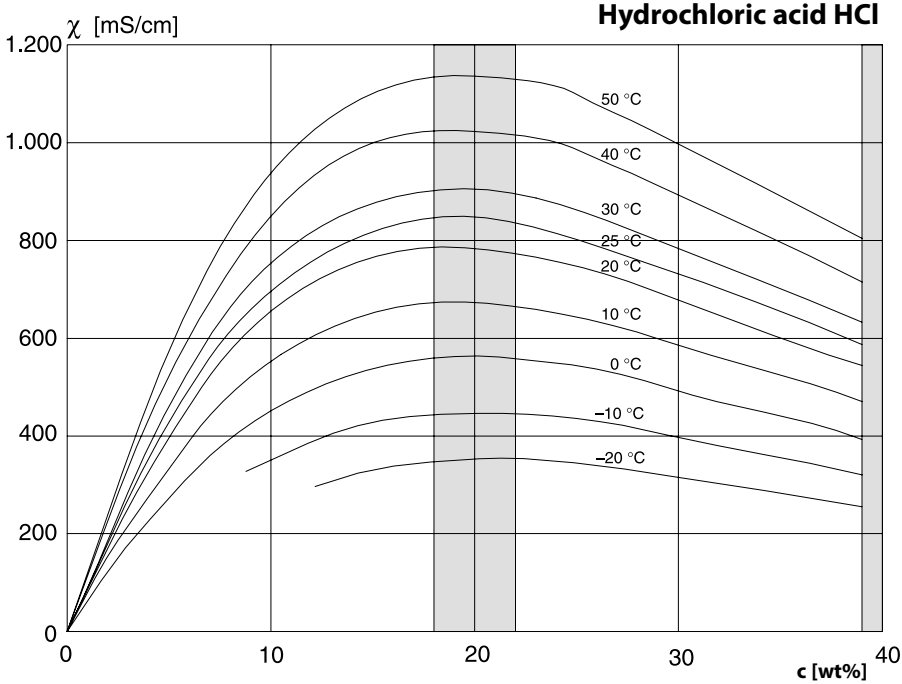
Nitric acid HNO_3



Hydrochloric acid HCl



Sodium hydroxide solution NaOH

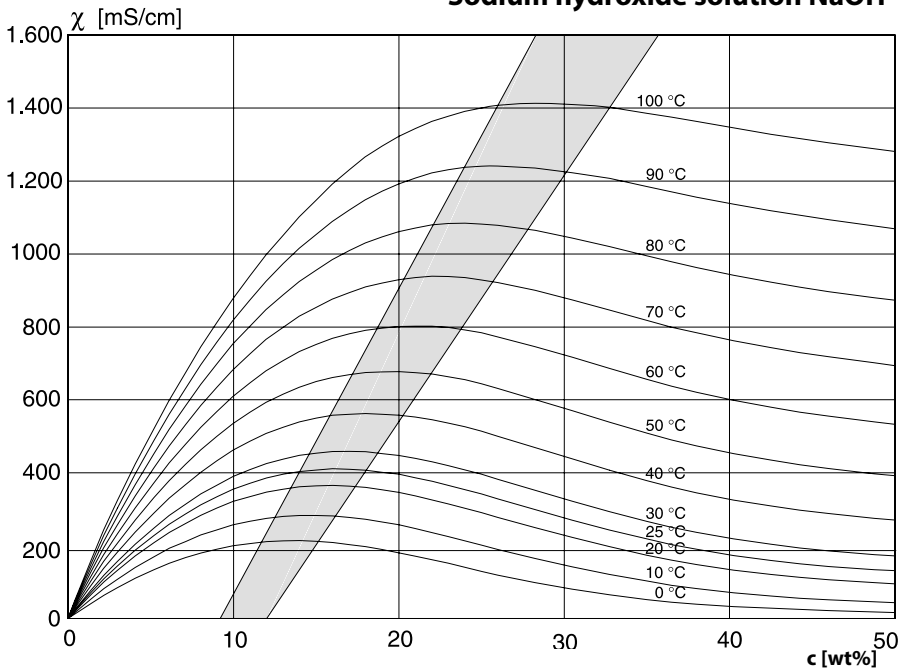


Table salt solution NaCl

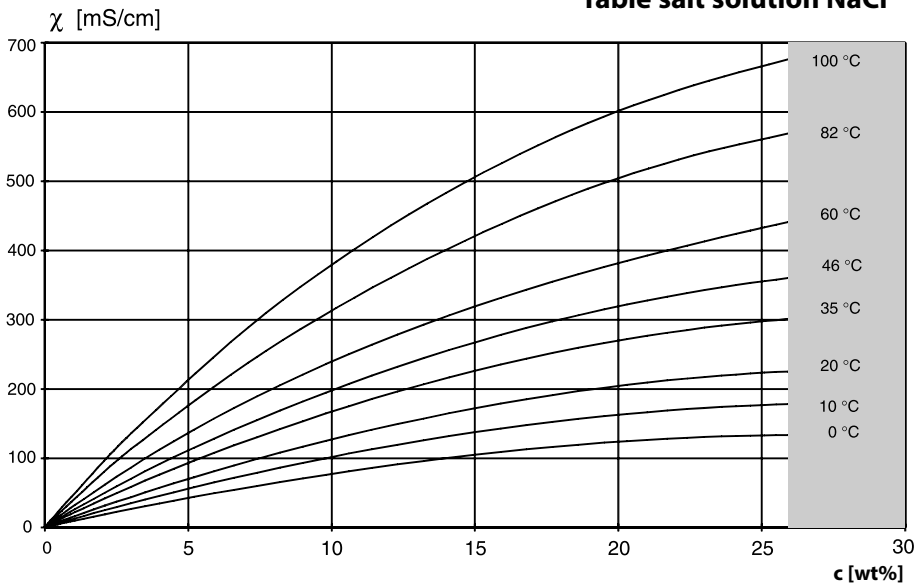
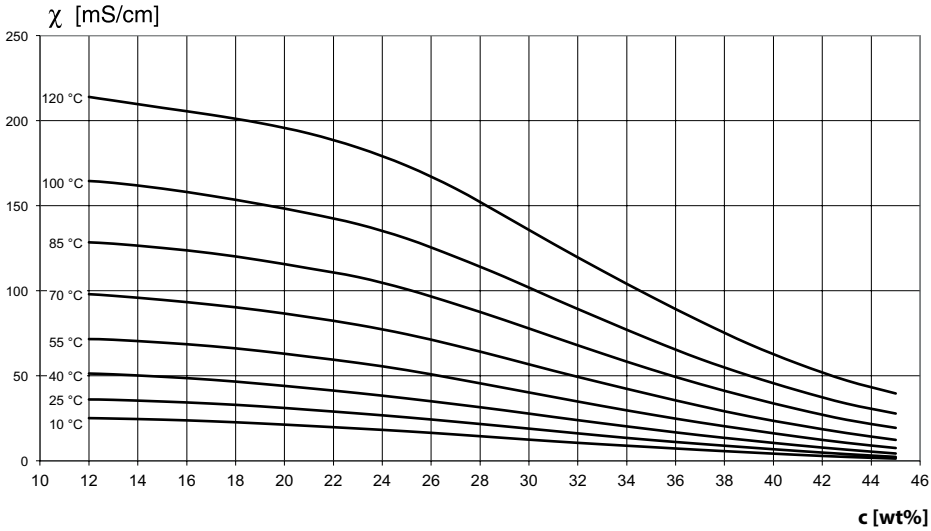


Oleum $H_2SO_4 \cdot SO_3$



Concentration Table

Select menu: Parameter setting > System control > Concentration table

Specifying a concentration solution for conductivity measurement
To specify the customer-specific solution, 5 concentration values A-E are entered in a matrix together with 5 temperature values 1-5. To do so, first enter the 5 temperature values, then enter the respective conductivity values for each concentration A-E.
These solutions will then be available in addition to the permanently stored standard solutions (select "Table").

Menu	Display	Action
par		**To enter values** • Open parameter setting • System control • Select "Concentration table"
		Enter 5 temperature values (right/left arrow keys to select position, up/down arrow keys to edit number, confirm by pressing **enter**.)
		Enter values for concentrations A-E for the respective temperatures. The table values must be continuous. Maxima/minima are not permitted. Incorrect entries are marked with ✕.

Note: The display may vary depending on the device version.

The concentration table is selected as follows:
Parameter setting > Module CONDI > Cal presettings:
Calibration mode: Automatic, Cal solution: Table.

Calculation Blocks

Select menu: Parameter setting > System control > Calculation Blocks
Calculation of new variables from measured variables

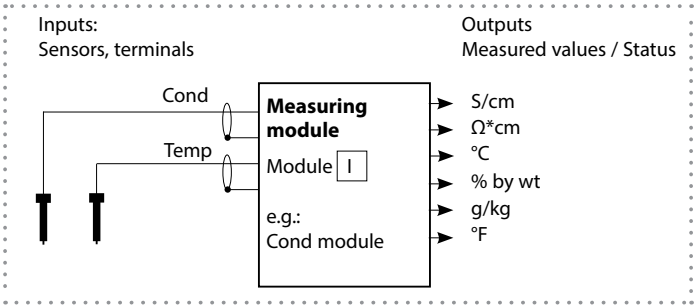
Calculation Blocks
Two measuring modules with all their measured values serve as input for the calculation block. In addition, the general device status (NAMUR signals) is taken into account. The difference between the existing values is calculated:

Current Outputs
All current outputs can be set to output the new process variables formed by the Calculation Blocks.

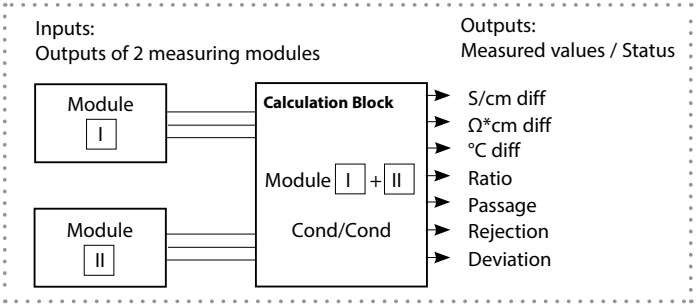
Measurement Display
All new process variables can be displayed as primary or as secondary value.

Controller
Controller functions are not supported.

Functionality of Measuring Module



Functionality of Calculation Block



Activating a Calculation Block

Select menu: Parameter setting > System control > Calculation Blocks

Combination of 2 Measuring Modules
With three measuring modules the following Calculation Block combinations are possible: [I] + [II] , [I] + [III] , [II] + [III]

Two Calculation Blocks can be activated.

Note: Function check (HOLD) mode active

Note: The display may vary depending on the device version.

Menu	Display	Action
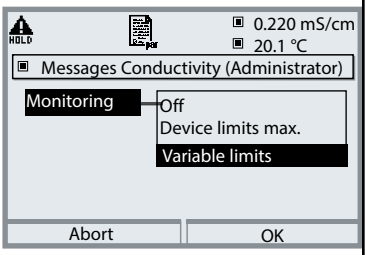
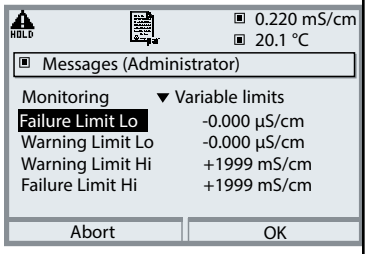
par		**Messages** All parameters determined by the measuring module can generate messages. • **Device limits max:** Messages are generated when the process variable (e.g. conductivity) is outside the measurement range. The "Failure" icon is displayed, the NAMUR failure contact is activated (BASE module, factory setting: contact K4, N/C contact). The current outputs can signal a 22 mA message (user defined). • **Variable limits:** For the "failure" and "warning" messages you can define upper and lower limits for message generation. • **Message icons:** Failure (Failure limit HiHi/LoLo) Maintenance (Warning limit Hi/Lo)
		
		




diag		**Diagnostics menu** When the "Maintenance" or "Failure" icons are flashing in the display, you should open the Diagnostics menu. The messages are displayed in the "Message list".

Parameter Setting: BASE Module

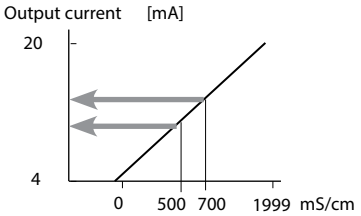
Menu selection: Parameter Setting > BASE Module
Note: Function check (HOLD) active

Note: The display may vary depending on the device version.

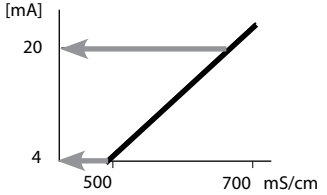
Menu	Display	Action
par		**Configuring the Current Output** • Open parameter setting • Enter passcode • Select "Module BASE" • Select "Output current ..."
		• Select process variable
		Select Curve, e.g. "Linear": The measured variable is represented by a linear output current curve. The desired range of the measured variable is specified by the values for "Start" and "End". See also: "Minimum span"

Assignment of Measured Values: Start (4 mA) and End (20 mA)

Example 1:
Range 0 ... 1999 mS/cm



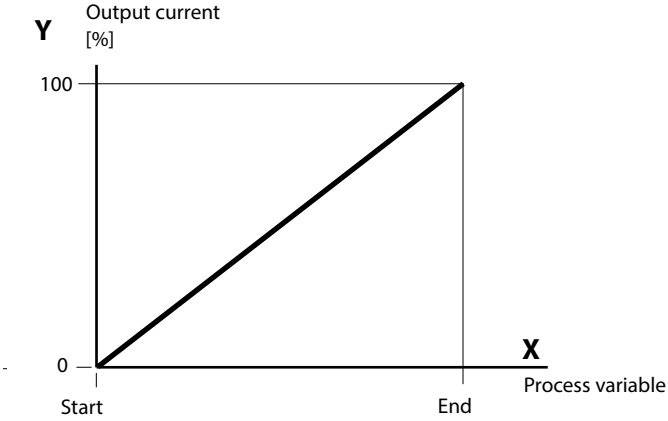
Example 2: Range 500 ... 700 mS/cm
Advantage: Higher resolution in range of interest



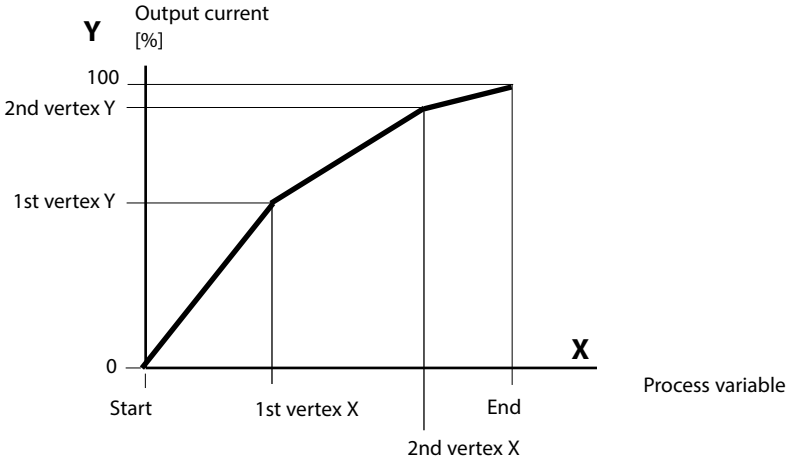
Current Outputs: Characteristics

Menu selection: Parameter setting > BASE module
Note: Function check (HOLD) mode active

- **Linear characteristic**
  The process variable is represented by a linear output current curve.



- **Trilinear characteristic**
  Two additional vertices must be entered:

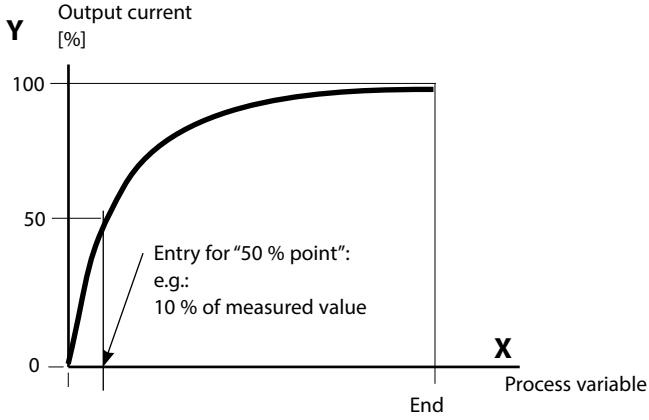


- **Note: Bilinear characteristic**
  For a bilinear characteristic, identical parameters are entered for the two vertices (1st vertex, 2nd vertex).

- **Function characteristic**

  Nonlinear output current characteristic: allows measurements over several decades, e.g. measuring very low values with a high resolution and high values with a low resolution.

  Required: Entering a value for 50 % output current.



Equation

$$\text{Output current (4 to 20 mA)} = \frac{(1+K)x}{1+Kx} \cdot 16\ \text{mA} + 4\ \text{mA}$$

$$K = \frac{E + S - 2 * X50\%}{X50\% - S} \qquad x = \frac{M - S}{E - S}$$

S: Start value at 4 mA
X50%: 50% value at 12 mA (output current range 4 to 20 mA)
E: End value at 20 mA
M: Measured value

Logarithmic output curve over one decade:
S: 10 % of maximum value
X50%: 31.6 % of maximum value
E: Maximum value

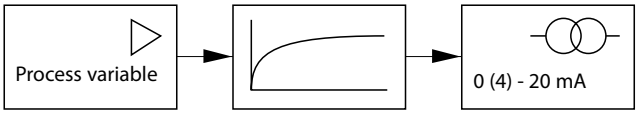
Logarithmic output curve over two decades:
S: 1 % of maximum value
X50%: 10 % of maximum value
E: Maximum value

Current Outputs: Output Filter

Parameter setting > BASE module > Output current I... > Output filter
Note: Function check (HOLD) mode active

Time Averaging Filter
To smoothen the current output, a low-pass filter with adjustable time interval can be switched on. When there is a jump at the input (100 %), the output level is at 63 % after the time interval has been reached.
The time interval can be set from 0 to 120 sec. If the time interval is set to 0 sec, the current output follows the input.

Note:
The filter only acts on the current output and the current value of the secondary display, not on the measurement display, the limit values or the controller!



Time interval 0 ... 120 sec

Note:
For further BASE module settings (behavior during messages, contacts, optocoupler inputs) refer to the user manual of the basic device.

Maintenance

Sensor monitor, temp probe adjustment
Note: Function check (HOLD) mode active

Menu	Display	Action
maint		**Open Maintenance** From the measuring mode: Press **menu** key to select menu. Select maintenance using arrow keys, confirm by pressing **enter**. Passcode 2958 (The passcode can be edited by the administrator.) Then select CONDI module.
		**Sensor Monitor** During maintenance, the sensor monitor allows validation of the sensor by immersing it in a known solution, for example, and checking the values measured.
		**Temp Probe Adjustment** [1] This function allows compensating for the individual temperature probe tolerance and the influence of the lead resistances to increase the accuracy of temperature measurement. Make sure that the process temperature is precisely measured using a calibrated reference thermometer when performing an adjustment! The measurement error of the reference thermometer should be less than 0.1 °C. Adjustment without precise measurement might result in considerable deviations of the measured value display!

Note: The display may vary depending on the device version.

1) With Protos II 4400(X) in the Calibration menu

Diagnostic Functions

General status information of the measuring system
Select menu: Diagnostics

Menu	Display	Action
diag		**Opening the Diagnostics Menu** From the measuring mode: Press **menu** key to select menu. Select diagnostics using arrow keys, confirm by pressing **enter**.
		The "Diagnostics" menu gives an overview of all functions available. Functions which have been set as "Favorite" can be directly accessed from the measuring mode.
		**Point of Meas Description** Allows entering a tag number and a note. Select position: left/right arrow key, select character: up/down arrow key. Confirm the entry by pressing **enter**.
		**Logbook** Shows the last events[1] with date and time, e.g. calibrations, warning and failure messages, power failure. This permits quality management documentation to ISO 9001. (For parameter setting, see p. 41)

Note: The display may vary depending on the device version.

1) Protos 3400(X): 50 events, Protos II 4400(X): 100 events

Menu	Display	Action
diag		**Device Description** Select module using arrow keys: Provides information about all modules installed: Function, serial number, hardware and software version and device options.
		**FRONT Module** The module contains the display and keypad control. Test possibilities: • Module diagnostics • Display test • Keypad test
		**BASE Module** The module generates the standard output signals. Test possibilities: • Module diagnostics • Input/output status
		Example: Module BASE, input/output status.

Note: The display may vary depending on the device version.

Diagnostic Functions

Menu selection: Diagnostics > COND ... Module
Module diagnostics, sensor monitor, cal record

Menu	Display	Action
diag		**Opening the diagnostics menu** From the measuring mode: Press **menu** key to select menu. Select diagnostics using arrow keys, confirm by pressing **enter**. Then select "Module CONDI".
		The Diagnostics menu gives an overview of all diagnostic functions available. Messages set as "Favorite" can be called up directly from the measuring mode using a softkey. To configure: Parameter setting > System control > Function control matrix.
		**Module Diagnostics** Internal function test (without Fig.). **Sensor Monitor** Shows the values currently measured by the sensor. Important function for diagnostics and validation! (cf Maintenance)
		**Calibration/Adjustment Record** Data of the last adjustment/calibration **Temp. Offset Log** Shows the data from the last temperature adjustment performed on the currently connected sensor.[1)]

Note: The display may vary depending on the device version.

1) with Protos II 4400(X)

Setting Diagnostic Messages as Favorite

Menu selection: Parameter setting > System control > Function control matrix

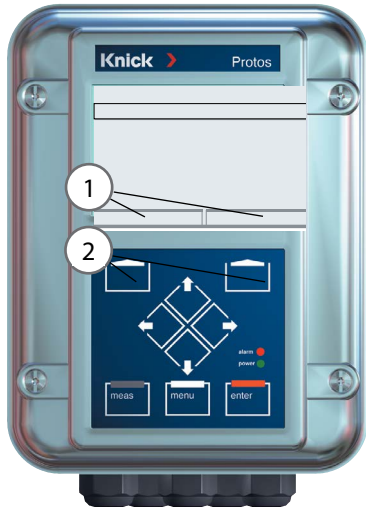
Secondary displays (1)
Here, additional values are displayed in the measuring mode according to the factory setting. When the respective softkey (2) is pressed, the process variables measured by the modules plus date or time are displayed. In addition, you can use the **softkeys (2)** to control functions.
To assign a function to a softkey, select

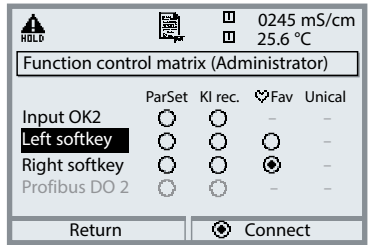
Parameter setting/System control/ Function control matrix

Function which can be controlled by softkeys:

- Parameter set selection
- KI recorder Start/Stop[1)]
- Favorites
- Unical (fully automated probe controller)[1)]

Favorites
Selected Diagnostic functions can be called directly from the measuring mode using a softkey.
The table on the next page explains how to select favorites.





Example:
"Favorites" to be selected with "Right softkey"

To select a softkey function:
Select desired function using arrow keys,
press "Connect" softkey and confirm with **enter**.

To deselect a function:
Press "Disconnect" softkey, confirm with **enter**.

1) With Protos 3400(X)

Menu	Display	Action
		**Favorites menu** Diagnostic functions can be called directly from the measuring mode using a softkey. The "Favorites" are selected in the Diagnostics menu.
diag		**Select favorites** Press **menu** key to select menu. Select diagnostics using arrow keys, confirm with **enter**. Then select module and confirm with **enter**.
		Set/delete favorite: "Set favorite" allows activation of the selected diagnostic function directly from the measuring mode via softkey. The menu line is marked with a heart icon.
		Pressing the **meas** key returns to measurement. When the softkey has been assigned to "Favorites", "Favorites menu" is read in the secondary display (see "Function control matrix").

Note: The display may vary depending on the device version.

Note:
When one of the softkeys has been assigned to the "Favorites menu" function, diagnostic functions which have been set as "Favorite" can be directly called from the measuring mode.

Diagnostic Functions

General status information of the measuring system
Menu selection: Diagnostics > Message list

Menu	Display	Action
diag		**Opening the diagnostics menu** From the measuring mode: Press **menu** key to select menu. Select diagnostics using arrow keys, confirm by pressing **enter**.
		The "Diagnostics" menu gives an overview of all functions available. Functions which have been set as "Favorite" can be directly accessed from the measuring mode.
		**Message list** Shows the currently activated warning or failure messages in plain text. **Number of messages** When there are more than 7 messages, a vertical scrollbar appears. Scroll with the up/down arrow keys. **Message identifier** See message list for description. **Module identifier** Specifies the module that has generated the message.

Note: The display may vary depending on the device version.

2) Rated operating conditions, ± 1 count
3) Rated operating conditions, ± 1 count, with NTC > 100 °C/212 °F: 0.2 % meas.val. + 1 K

General Data

Explosion protection (Ex version of module only)	For entity parameters, see attachment to certificates or control drawings.
RoHS conformity	According to EU directive 2011/65/EU
EMC	EN 61326-1, EN 61326-2-3 NAMUR NE 21
Emitted interference	Industrial applications[1)]
Interference immunity	(EN 55011 Group 1 Class A) Industrial applications
Lightning protection	to EN 61000-4-5, Installation class 2
Rated operating conditions (module installed)	
Ambient temperature	Safe area: -20 ... 55 °C / -4 ... 131 °F Ex: -20 ... 50 °C / -4 ... 122 °F
Relative humidity	5 ... 95 %
Climatic class	3K5 according to EN 60721-3-3
Location class	C1 according to EN 60654-1
Transport/storage temperature	-20 ... 70 °C / -4 ... 158 °F
Screw clamp connectors	Single or stranded wires 0.2 ... 2.5 mm^2 Tightening torque 0.5 ... 0.6 Nm
Wiring	Stripping length max. 7 mm Temperature resistance > 75 °C / 167 °F

1) This equipment is not designed for domestic use, and is unable to guarantee adequate protection of the radio reception in such environments.

Appendix

Minimum Spans for Current Outputs

The CONDI 3400(X)-051 module is a measuring module. It does not provide current outputs. Current outputs are provided by the BASE module (basic device) or by communication modules (e.g. OUT module). The corresponding parameters must be set there.

The minimum current span shall prevent that the resolution limit of the measurement technology (± 1 count) is seen in the current.

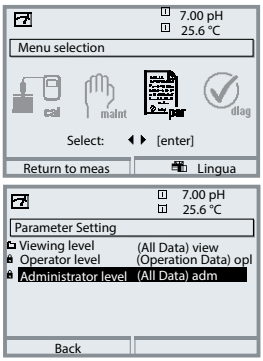
CONDI 3400(X)-051 Module

S/cm	20 %, min. 100.0 µS/cm
wt%	1.00
°C	10.0
g/kg	1.00
Ohm*cm	20 %, min. 100.0 ohms*cm
°F	10.0

Calculation Block COND/COND

Diff S/cm	20 %, min. 100.0 µS/cm
Diff °C	10.0
Diff Ohm*cm	20 %, min. 100.0 ohms*cm
RATIO	0.10
PASSAGE	10.0
REJECTION	10.0
DEVIATION	10.0

Parameter Setting Menu



Parameter Setting

From measuring mode: Press **menu** key to select menu.
Select parameter setting using arrow keys,
press **enter** to confirm.

Administrator level
Access to all functions, also passcode setting. Releasing or blocking functions for access from the Operator level.

Operator level
Access to all functions which have been released at the Administrator level. Blocked functions are displayed in gray and cannot be edited.

Viewing level
Only display, no editing possible!

System Control

Memory card (Option)	Menu only appears when a memory card is inserted and the corresponding add-on function has been enabled.
Transfer configuration	The complete configuration of a device can be written on a memory card. This allows transferring all device settings to other devices with identical equipment (exception: options and passcodes).
Parameter set	2 parameter sets (A, B) are available in the device. The currently active parameter set is shown in the display. Parameter sets contain all settings except: sensor type, options, system control settings Up to 5 parameter sets (1, 2, 3, 4, 5) are available when a memory card (Option) is used.
Function control	Select the functions to be controlled via softkeys and OK inputs
Time/date	Time, date, display format
Meas. point description	Free input of a tag number, can be called from the diagnostics menu
Release of options	Option activation via TAN
Reset to default	Reset all parameters to factory setting
Passcode entry	Change passcodes
Firmware update	Update the firmware using an Update Card
Logbook	Select the events to be recorded

Note: The menus may vary depending on the device version
